CLAIM AMENDMENTS

IN THE CLAIMS

This listing of the claims will replace all prior versions, and listing, of claims in the application or previous response to office action:

1. (Currently Amended) A sealing device comprising a conducting element which can be inserted off-center in a through-hole in a housing wall, and which has a sealing body touching both the conducting element and the housing wall,

wherein in the region where the sealing body contacts the conducting element and the housing wall, the cross-sectional profile of the housing-wall and the conducting [[-ing]] element has at least one recess within which the sealing body can be moved in a radial direction.

2. (Currently Amended) [[S]] A sealing device in accordance with claim 1, wherein

the sealing body has one axial seal located in the recess and a further radial seal which mates with a surface which bounds the space between the connector body and the housing wall.

3. (Currently Amended) [[S]] <u>A sealing device in accordance with claim 1, wherein</u>

the sealing body can be fixed by means of a clamping device which applies a force to the sealing body in the axial direction.

- 4. (Canceled)
- 5. (Currently Amended) [[S]] A sealing device in accordance with claim 4, wherein
- a sealing ring with an internal thread can be screwed onto the conducting element to fix the sealing body.
 - 6. (Canceled).

- 7. (Canceled).
- 8. (Currently Amended) [[S]] A sealing device in accordance with claim 5, wherein an end stop is formed on the sealing body in a position which lies within the recess.
- 9. (Currently Amended) [[S]] <u>A sealing device in accordance with claim 1, wherein the sealing body is attached to the conducting element by means of a positive retainer.</u>
 - 10. (Currently Amended) A method for sealing comprising the step of:
- using a sealing device comprising a conducting element which can be inserted offcenter in a through-hole in a housing wall, and which has a sealing body touching both the conducting element and the housing wall,

wherein in the region where the sealing body contacts the conducting element and the housing wall, the cross-sectional profile of the <u>housing wall and the</u> conduct<u>ing</u> [[-ing]] element has at least one recess within which the sealing body can be moved in a radial direction.

to seal an eccentric through-hole for a conducting element, through the housing wall of a gearbox.

11. (Currently Amended) The $\underline{\mathbf{A}}$ method in accordance with claim 10, further comprising the step of:

fixing the sealing body by means of a clamping device which applies a force to the sealing body in the axial direction.

12. (Currently Amended) The $\underline{\mathbf{A}}$ method in accordance with claim 10, further comprising the step of:

screwing a sealing ring with an internal thread onto the conducting element which comprises the recess to fix the sealing body.

- 13. (Canceled).
- 14. (Currently Amended) The $\underline{\mathbf{A}}$ method in accordance with claim 10, further comprising the step of:

attaching the sealing body to the conducting element by means of a positive retainer.

- 15. (Currently Amended) [[M]] <u>A method</u> for assembling a sealing device, in which a conducting element and a sealing body are used in a through-hole in a housing wall, comprising the steps of:
- locating the sealing body in the radial direction in at least one recess provided in the contact area in the cross-sectional profile of the housing wall and the conducting element, and
- subjecting the sealing body to a force which acts in the axial direction by means of a clamping device which acts on the sealing body in an axial direction.
- 16. (Currently Amended) [[M]] <u>A method in accordance with claim 15</u>, wherein the sealing body is located in a radial direction in a recess formed in the eonducting element, and is subject to a force which acts in an axial direction is applied by an adjusting nut which can be screwed onto the conducting element.
 - 17. (Canceled).
